

# Whooping cough is not old-school.

GET A  
ONE-TIME  
BOOSTER

## Do you work with kids? **Protect them** by protecting yourself.

- Health care providers, teachers, daycare providers, and babysitters need a one-time Tdap (Tetanus, diphtheria and pertussis) booster.
- All** teenagers and adults who have close contact with an infant under 12 months old need a one-time Tdap booster.
- Because whooping cough (pertussis) symptoms in teenagers and adults may be mild and resemble a cold, they may continue to work and pass on the disease to children in their care.
- Whooping cough is **very** contagious. It can cause serious illness, and can be fatal in infants.
